

Due to the fact that many smart phones have curved edges while glass cannot be curved, the screen protector has to be designed smaller than the screen to prevent the "white edge effect". We sometimes choose glass screen protector with black or white plastic on the sides, which is usually called "full-coverage glass screen protector" and can cover the entire screen. These two types of screen protectors can both well protect your screen to survive from accidental bumps and drops. But they also have their own pros and cons as follows:

Type of Screen Protector	Pros	Cons
Pure Tempered Glass	• Easier to align for installation. • Can endure more drops and bumps.	• Look not so good due to the minor gap around the screen protector.
Pure Tempered Glass with Plastic Border	• Look better than the screen	• Slightly harder to install. • The screen protector itself may be more likely to get cracked in bumps and drops because of the uneven border.

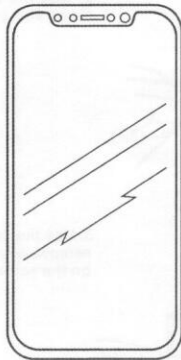

Androgate strives to offer the most economic and environmental smartphone protective solution. Please understand that the screen protectors are included as a bonus for ordering our phone case, and we do not have any screen protectors separately in stock. There is chance that glass may get cracked during delivery or installation. We may offer your partial refund for any screen protector issue when your contact us at service@androgate.com or message us using your amazon account.

Thank you for shopping with us!

1. Use the Alcohol Pre Pad to remove any dirt on the screen

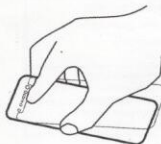

2. Use the Fiber Cloth to clean the screen.

3. Use the dust absorber to remove any dirt remaining on the screen.

4. Use one hand to hold the screen protector by the edges so that you don't leave fingerprints on the surface. And then peel off the film on its sticky side.

5. Very carefully align the screen protector with your phone's screen, making sure you line up the Home button, earpiece, and camera holes.

6. Slowly place the screen protector onto your screen, starting from one end and carefully working your way to the other. Tab the center of the screen protector and it will start to adhere to your screen. If there are any bubbles, use your finger to press down and drive the bubbles out towards the closest edge. Then your phone screen is protected!
